

WATER SYSTEMS · RESPONSIBLE INTELLIGENCE

Software that *flows.*

Applied AI and software for messy information, real decisions, and a living world.

TEREGON LABS

STUDIO DECK / 2026

One parent.
Three clear layers.

A simple structure connects Teregon's point of view to what we build and where we apply it.

01 / PARENT BRAND

Teregon

A systems-minded identity for a living, changing world.

02 / CAPABILITY STUDIO

Teregon Labs

Applied AI and software: grounded assistants, decision systems, and production tools.

03 / WATER INTELLIGENCE

Teregon Water

Watershed systems and software for water filtration and appliance operators.

CONFIGURABLE WATER-SECTOR OFFERINGS · NOT CLAIMED AS DEPLOYED WATER CLIENT SYSTEMS

Manual-grounded service assistant

Answers from approved manuals and product guidance; hands off when sources do not cover the question.

Deterministic case triage

Routes service cases through explicit policy checks, with review before consequential actions.

Support signal + QA

Surfaces repeat issues, product questions, and service-quality patterns across support records.

02 / WHAT WE BUILD

The signal becomes *a useful system.*

We work where information is scattered, workflows are hard to see, and the next decision matters.

APPLIED AI

Grounded assistants

Search trusted sources, summarize records, triage requests, and prepare next steps for review.

DATA + DECISION SYSTEMS

Signals in one view

Connect CRM, product, support, and field records into forecasts and decision-ready tools.

SOFTWARE ENGINEERING

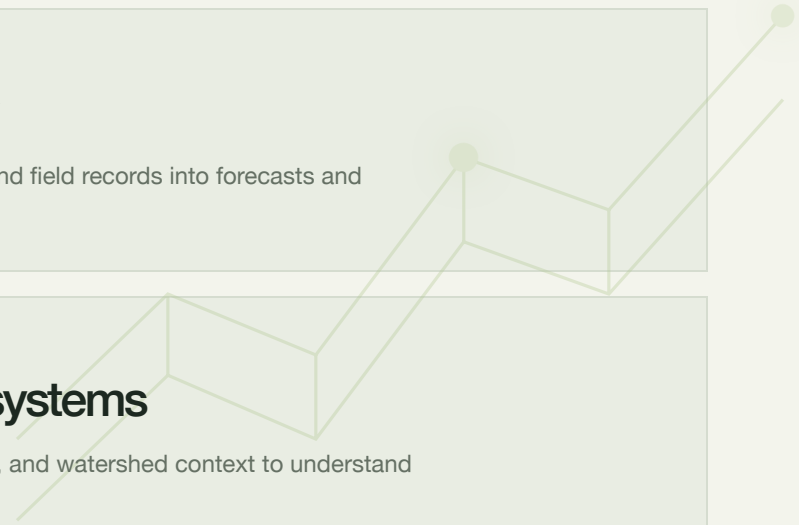

Production software

Ship web apps, internal tools, integrations, and reliable data paths around real work.

WATER INTELLIGENCE

Watershed + river systems

Connect rainfall, river observations, and watershed context to understand how water moves across a place.

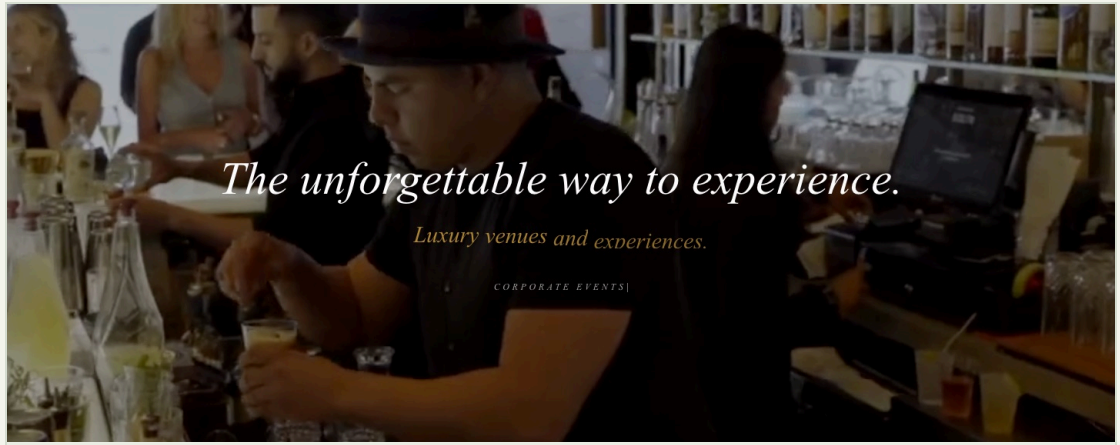

RETRIEVAL · AGENTS · FORECASTS · WATERSHED SIGNALS

DESIGN → BUILD → IMPROVE

Built for the *real-world journey.*

Two distinct businesses, each with a clear digital path and a live production website.

HOSPITALITY / EVENTS · LIVE

ERIA Events

Venue and experience discovery connects event stories and press to private and corporate inquiries.

VENUE DISCOVERY | INQUIRY FLOW

NEXT.JS 16 · REACT 19 · SANITY CMS

EXECUTIVE SEARCH · LIVE

W3 Sourcing

Practice, methodology, results, and leadership context guide visitors toward a direct inquiry.

SERVICE STORY | DIRECT INQUIRY

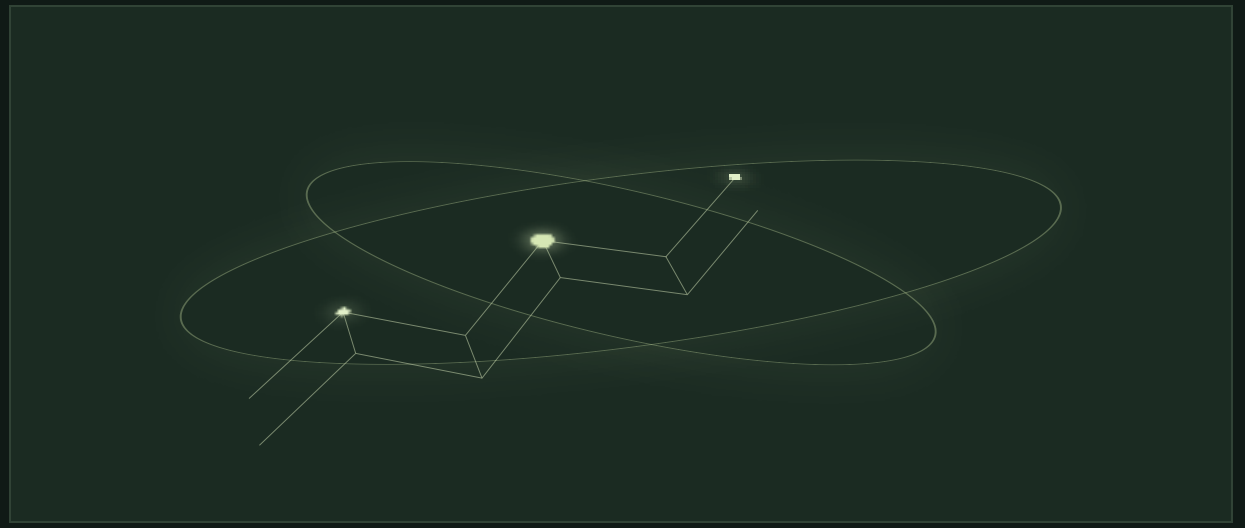

NEXT.JS 16 · REACT 19 · TYPESCRIPT

Support triage with *evidence gates.*

A Salesforce e-commerce support workflow that gathers context, retrieves policy and product evidence, and proposes an action for review.

LANGGRAPH	Gather case context → retrieve → image-read → plan and call tools → extract a proposed update.
DETERMINISTIC GATES	Python checks decide which fields may be written; dry-run and safe-stop paths keep uncertain cases reviewable.
OBSERVABILITY	Langfuse traces make the agent's steps inspectable.

SUPPORT CASE → GROUNDED PROPOSAL → HUMAN / RULE CHECK → OPTIONAL SALESFORCE WRITE

COMPANY-LEVEL CONTEXT

Company-level ARR context reported by the team; not attributed to this system.

~$240K ARR at the time

A support library that stays *grounded.*

An internal knowledge system that gives support teams a maintained source, searchable history, and chat over retrieved context.

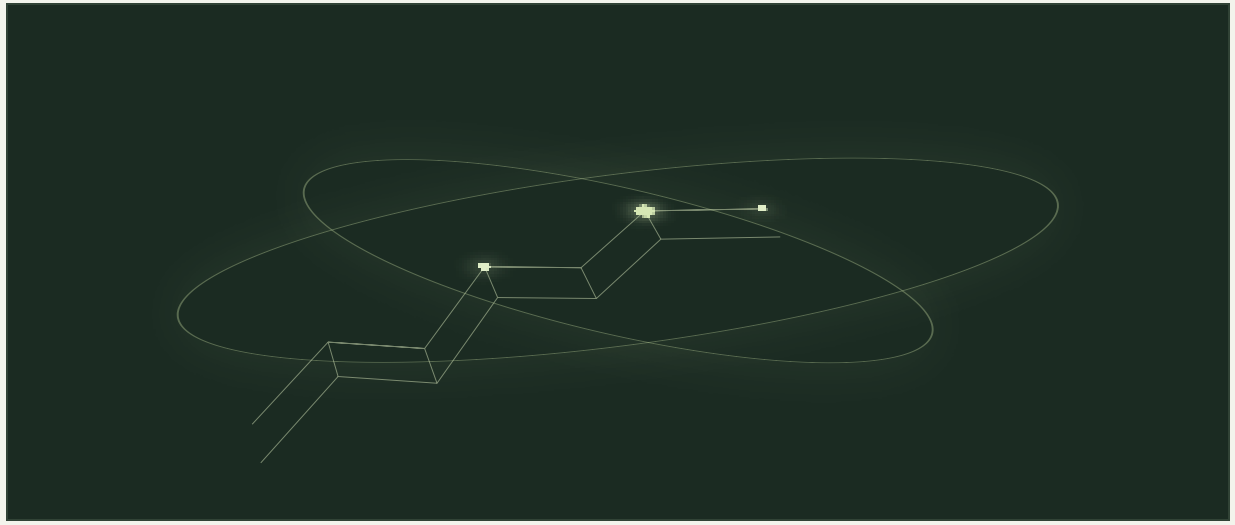

SOURCE	Git-backed wiki corpus; updates retain version history.
RETRIEVAL	FAISS finds relevant passages from the source library.
CHAT	FastAPI + Next.js app with provider-agnostic local/cloud LLMs; answers use retrieved context.

DOCKER COMPOSE · SOURCE-BOUND SUPPORT KNOWLEDGE

COMPANY-LEVEL CONTEXT

~$2M ARR now

Company-level ARR context reported by the team; not attributed to this system.

TEAM PRODUCT EXPERIENCE · NOT A TEREGON CLIENT DEPLOYMENT

GIT · FAISS · FASTAPI · NEXT.JS · LLM CHAT

Water moves through a *connected system.*

Illustrative Teregon Water concepts—not deployed products—show how river and watershed signals could support planning.

WATERSHED / ILLUSTRATIVE

From ridge to river

Combine land cover, rainfall, stream observations, and nearby assets to explore upstream-to-downstream connections.

RIVER FLOW / ILLUSTRATIVE

Follow the flow

Bring rainfall, tributary, and stream observations together to explore how conditions change along a river system.

07 / A PRACTICAL WAY TO START

Measure the *change that matters.*

Start with the decision and a baseline. Ship in the real workflow, then verify what changed.

01 / UNDERSTAND

Scope the decision

Map the workflow, sources, constraints, and owner.

02 / PROTOTYPE

Build the smallest useful system

Connect data, interfaces, models, and checks.

03 / DEPLOY

Put it into the work

Keep people, permissions, and failure paths in view.

04 / IMPROVE

Verify the outcome

Compare against an agreed baseline and refine.

POSSIBLE MEASURES · TIME TO FIND AN ANSWER · REPEAT ISSUE RATE · FORECAST VARIANCE · TIME TO INTERPRET WATERSHED SIGNALS
WE PUBLISH IMPACT ONLY WHEN THE EVIDENCE IS VERIFIED.

DISCOVERY → PILOT → PRODUCTION → ITERATION

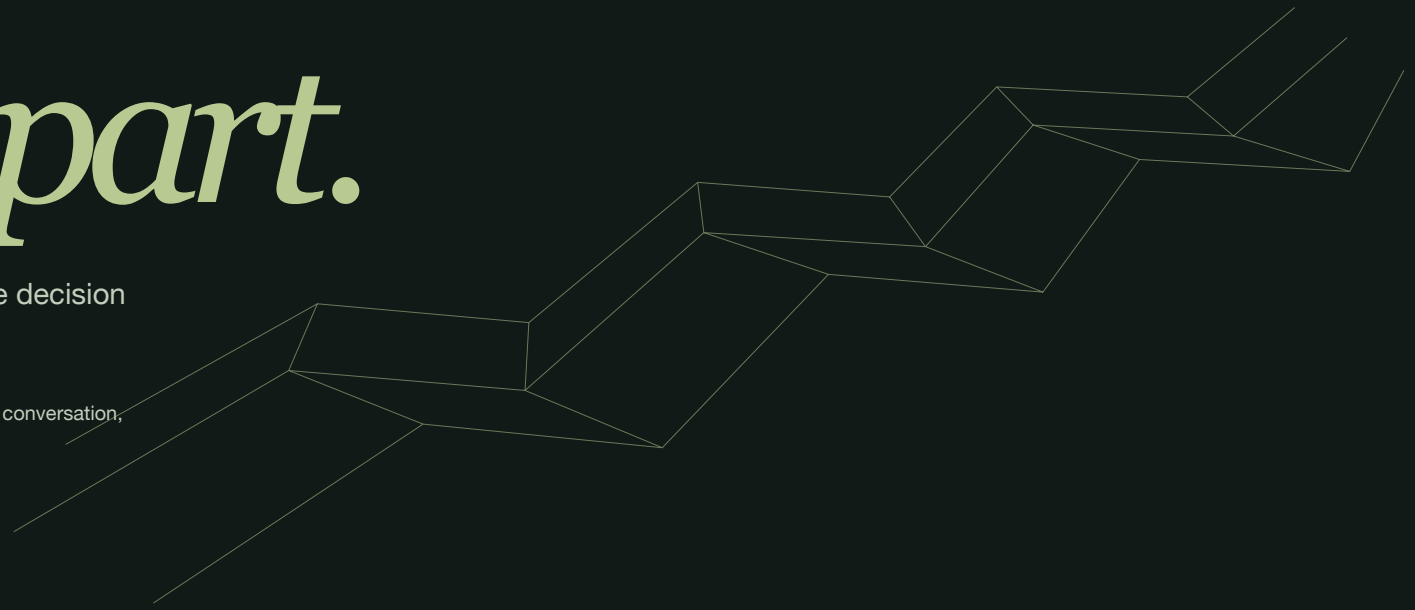

NO OUTCOME NUMBERS WITHOUT A VERIFIED BASELINE

WATER SYSTEMS · RESPONSIBLE INTELLIGENCE

Bring us the *messy part.*

Tell us what is stuck: the workflow, the scattered sources, or the decision that needs a clearer view.

The website assistant is a source-grounded guide to Teregon's published work. For a project conversation, email us directly.
